Glossary of Terms

Appendix C. Glossary of Terms

<i>Non-Negligible Shadow flicker Source or equivalently Significant Shadow flicker Source</i>	A shadow flicker emission source which is determined to have a significant influence on the resultant shadow flicker exposures at a shadow flicker sensitive receptor. This is typically determined from a combination of site observations, measurements and available sound pressure or power data. Acoustical shielding effects or distance attenuation are often used as justification for excluding sources from this category.
<i>Point of Reception or Shadow flicker Sensitive Receptor</i>	Locations where excessive shadow flicker may disrupt the lives or activities of occupants/residents or in general where excessive shadow flicker would interfere with the intended use of the location under consideration.
